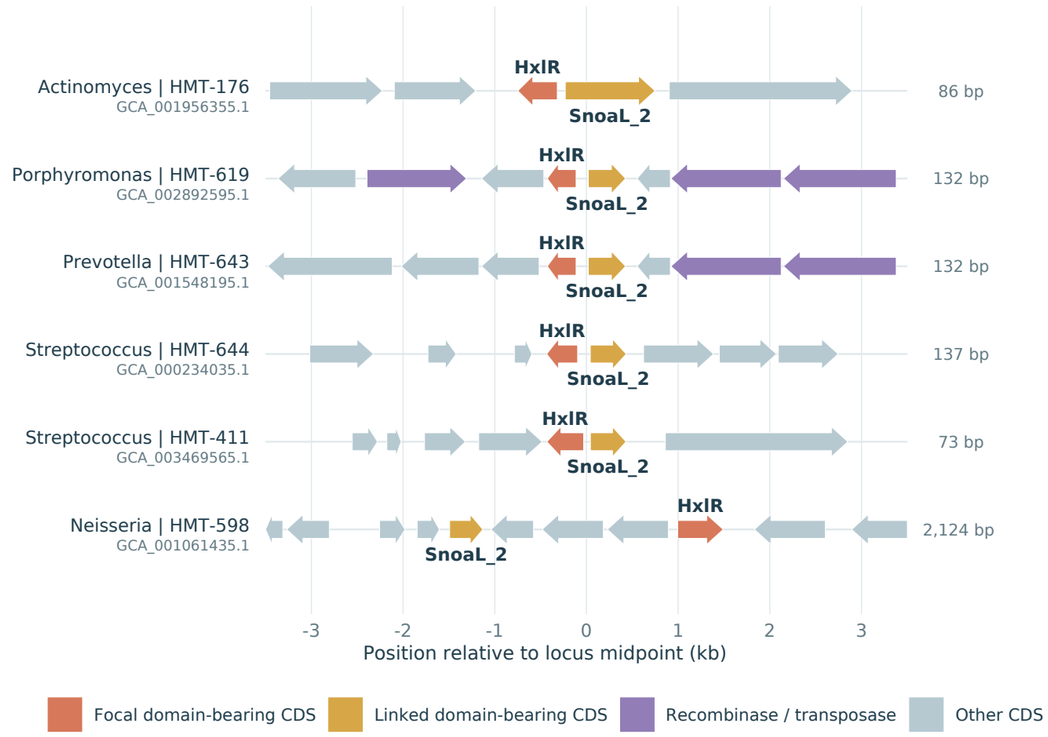
A

HxlR-SnoaL_2 genomic neighbourhoods

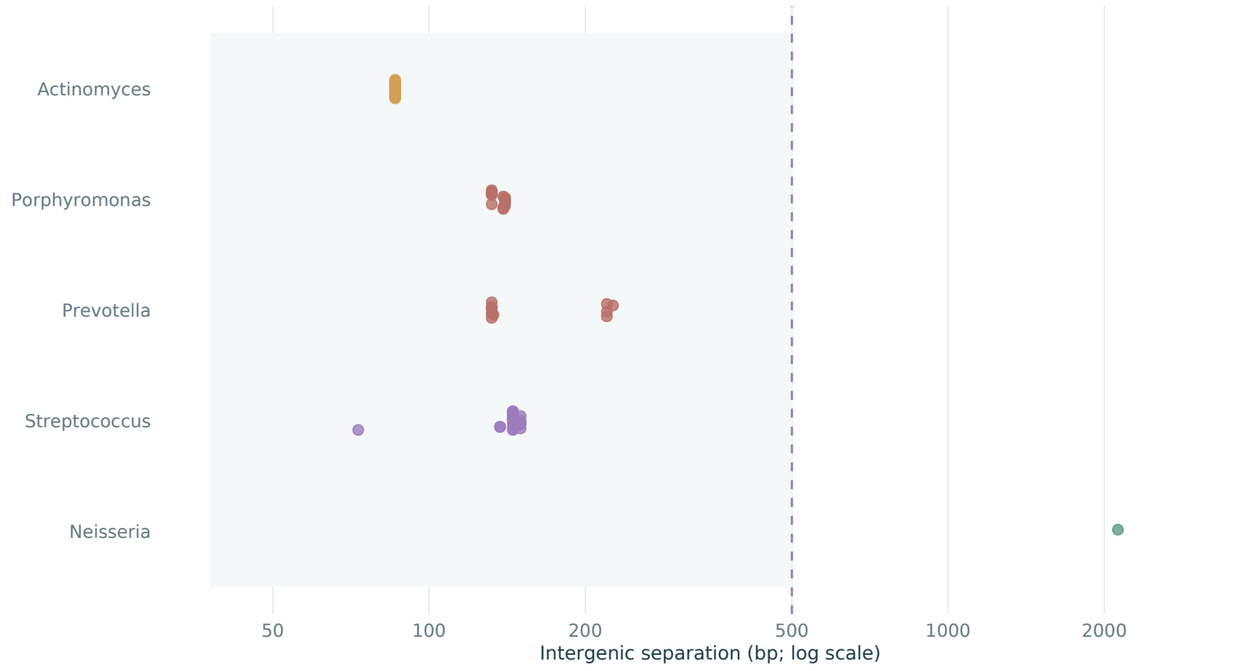
Six assemblies representing five genera; actual CDS positions and strands



B

Spacing across all linked genomes

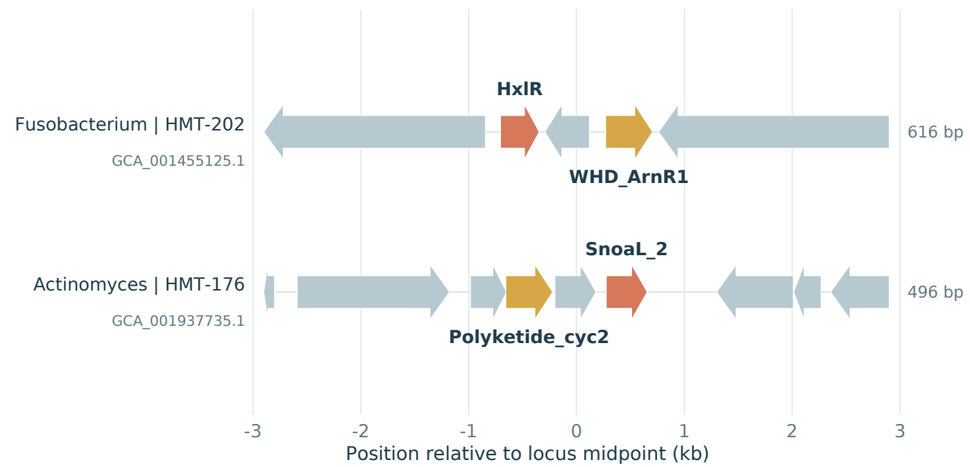
66 of 67 arrangements are divergent within 500 bp



C

Alternative linked-domain arrangements

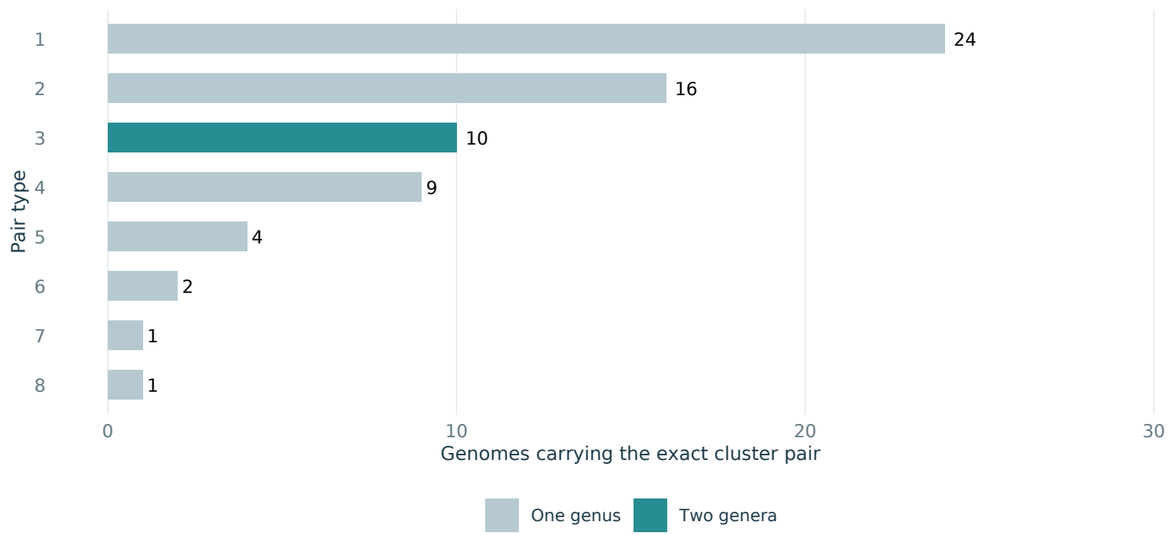
Actual gene coordinates in Fusobacterium and Actinomyces



D

Eight protein-cluster pair types

Only one pair type spans more than one genus



Gene adjacency and orientation do not establish shared regulation, identical protein function or independent evolutionary gains. Linkage enrichment with plaque affinity: two-sided P = 0.217.
